

VirtualBox Guest Additions Install

In this tutorial, I will be demonstrating the installation of VirtualBox's **Guest Additions** so that you can make use of shared folders, as well as, the [VBoxManage guestcontrol](#) command to manage the guest VM from the host machine. In a future tutorial, I will demonstrate how to use the **guestcontrol** command in a PowerShell script to automatically start a VM, as well as, start PuTTY to open an SSH connection to the VM.

I will be performing the Guest Additions installation on a virtual machine with a CentOS 7 minimal install (no GUI).

Refer to the prerequisites listed below to access the resources needed to complete this tutorial.

Prerequisites

- VirtualBox & VirtualBox Extension Pack
- VirtualBox VM with a CentOS 7 minimal installation
- non-root user with **sudo** privileges
- Active Internet Connection

For instructions on how to install VirtualBox and extension pack, see my **VirtualBox Install** tutorial [here](#).

If you do not already have a virtual machine, with a minimal install of CentOS 7, my other tutorial is [here](#).

If you already have access to a CentOS 7 minimal install VM, but do not have a non-root user with **sudo** privileges, my other tutorial can be accessed [here](#).

Steps to complete tutorial:

1. [Take Post CentOS 7 Install Snapshot](#)
2. [Create non-root user with **sudo** privileges](#)
3. [Update CentOS 7](#)
4. [Take Pre Guest Additions Install Snapshot](#)
5. [VirtualBox Guest Additions](#)
 - a. [Prerequisite Packages Install](#)
 - b. [Guest Additions Install](#)
6. [Test Guest Additions Features](#)
 - i. [Shared Folders](#)
 - ii. [Remote VM Management](#)
7. [Take Post Guest Additions Snapshot](#)

Take Post CentOS 7 Install Snapshot

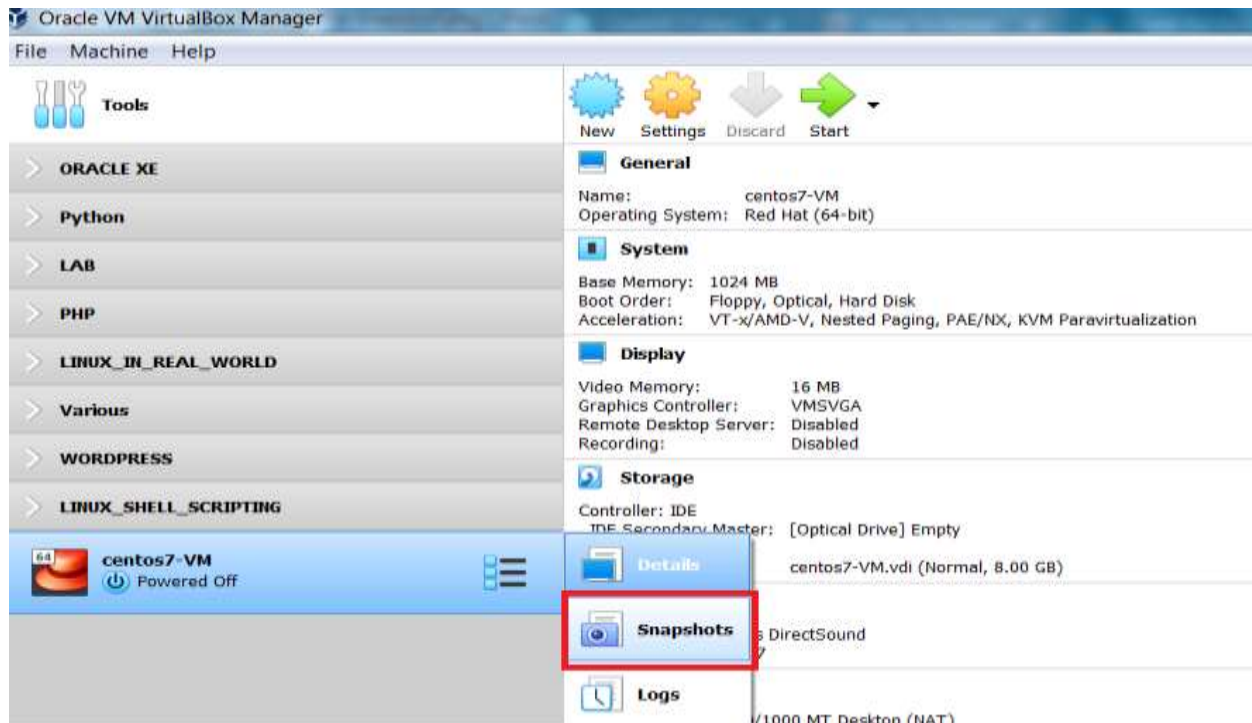

The reason I want to take a snapshot, before we begin, is that we will be making a number of major changes to the virtual machine. After successfully completing a major change, I find it helpful to create (take) a snapshot to act as a fallback mechanism. If something goes wrong during a major change, we can revert back to a working snapshot (previous stable state).

If you've completed my **CentOS 7 Server Install** tutorial, then, you've already taken this snapshot and can skip to the next step ([Update CentOS 7](#)).

If you already have a CentOS 7 minimal install VM. I suggest taking a snapshot before continuing with the tutorial, to ensure that you have a starting point to revert back to.

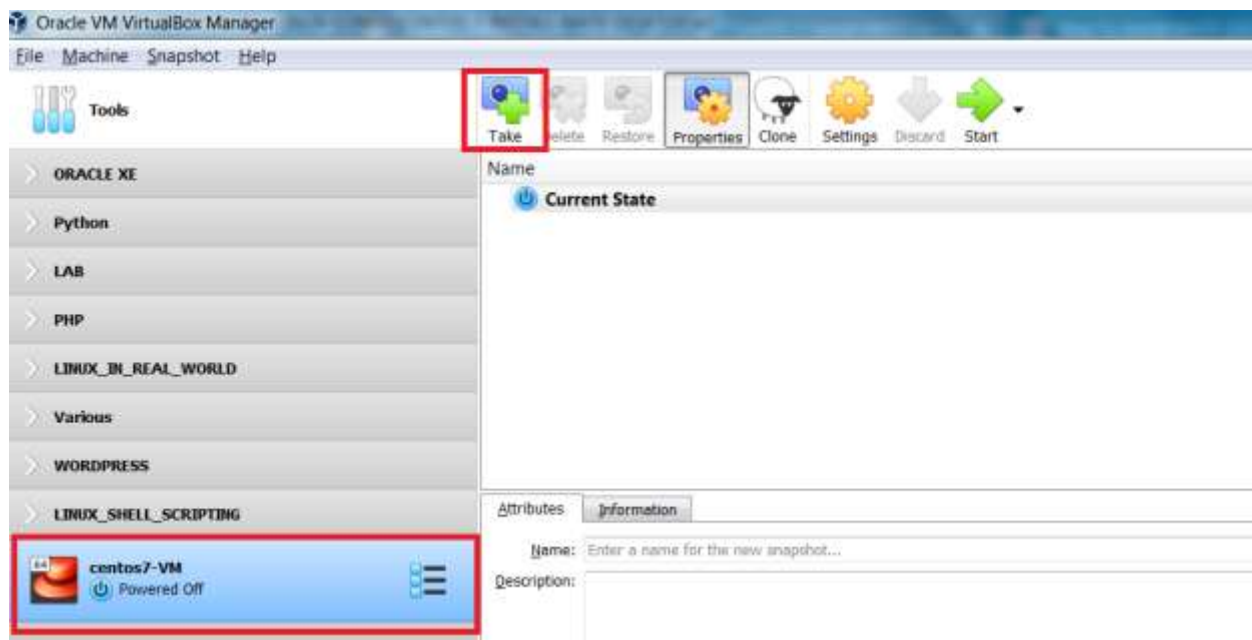

Please note that you can name the snapshot whatever you like, just remember which snapshot is associated with which state of the virtual machine.

In the VirtualBox Manager interface, we are currently in **Details** view. To switch to **Snapshots** view, click the list icon next to the virtual machine name, and select **Snapshots**.

The “**Snapshots**” view will show you a listing of the snapshots created for the virtual machine.

From the VirtualBox Manager’s interface, again, ensure your VM is selected, then, to create a snapshot click **Take**

Enter a name for the snapshot, as well as, a short description, then, click **OK**

I've taken a snapshot "**POST-CentOS7-MINIMAL-INSTALL**" to ensure that I have a starting point to revert back to, if needed.

Before installing the **Guest Additions**, we will ensure that our CentOS 7 install is up to date.

To perform a CentOS 7 system update, we need a non-root user with **sudo** privileges.

Create non-root user with sudo privileges

If you already have a non-root user with **sudo** privileges, please skip to the next step ([Update CentOS 7](#))

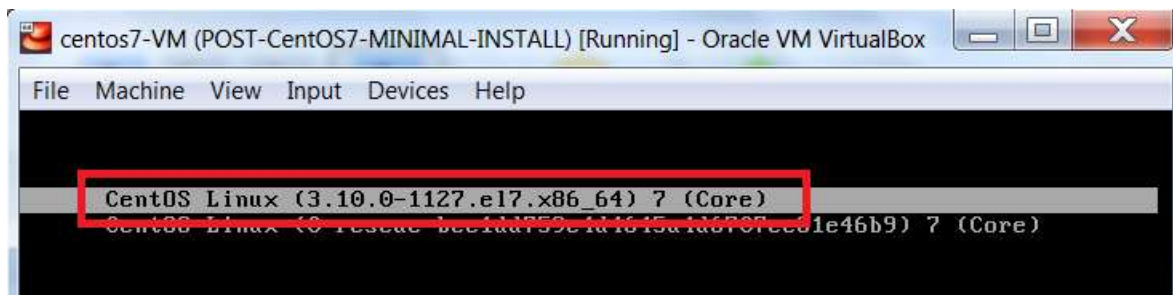

If not, please complete my other tutorial, **Create Non-Root User**, accessible [here](#). Then, return here to complete this tutorial.

Update CentOS 7

From the VirtualBox Manager interface, ensure your VM is selected and click **Start**

During start up, you will see which kernel is being used. Make a note of this as it will change post system update.

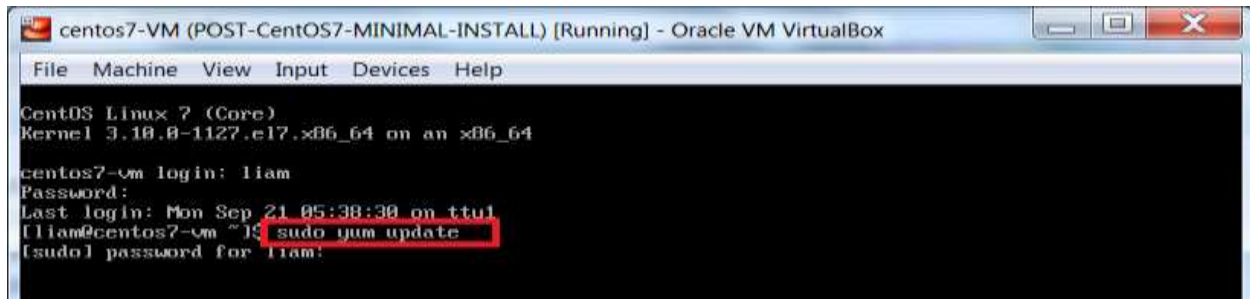

We will be using a non-root user with **sudo** privileges ('**wheel**' group member) to update our system.

Once, the virtual machine has started, login with your non-root user that has **sudo** privileges.

To update CentOS 7, from the command line, execute the following:

```
$ sudo yum update
```

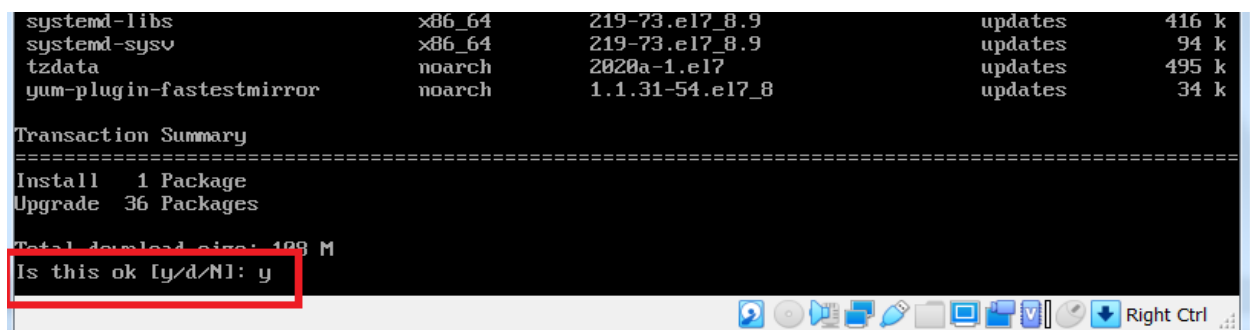

```
centos7-VM (POST-CentOS7-MINIMAL-INSTALL) [Running] - Oracle VM VirtualBox
File Machine View Input Devices Help

CentOS Linux 7 (Core)
Kernel 3.10.0-1127.el7.x86_64 on an x86_64

centos7-vm login: liam
Password:
Last login: Mon Sep 21 05:38:30 on ttul
liam@centos7-vm ~]$ sudo yum update
[sudo] password for liam:
```

When prompted, enter **y** to accept the packages to be downloaded, installed and upgraded.

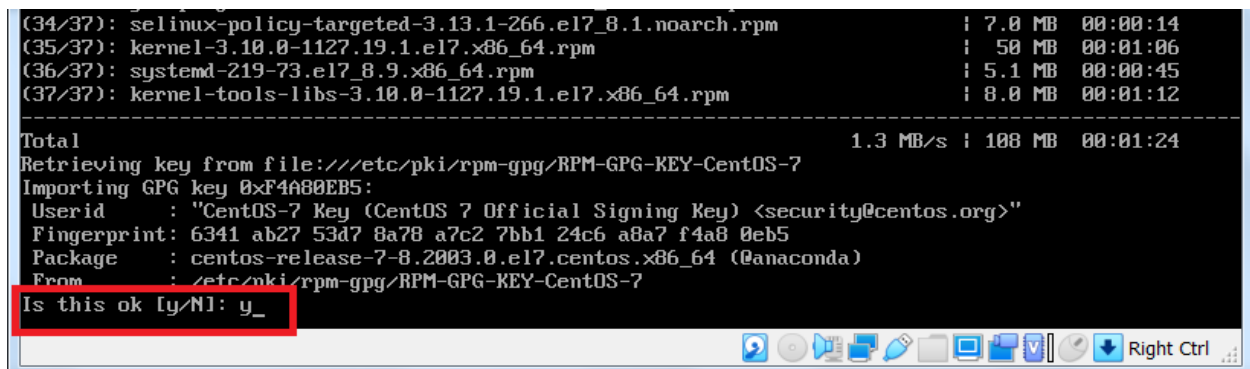

```
systemd-libs                x86_64                219-73.el7_8.9          updates                416 k
systemd-sysv                x86_64                219-73.el7_8.9          updates                94 k
tzdata                      noarch                2020a-1.el7             updates                495 k
yum-plugin-fastestmirror    noarch                1.1.31-54.el7_8         updates                34 k

yum-plugin-fastestmirror.noarch 0:1.1.31-54.el7_8

Complete!
liam@centos7-vm ~]$
```

Let's reboot to ensure the newly installed kernel will be used as the core interface between the computer's hardware and its processes.

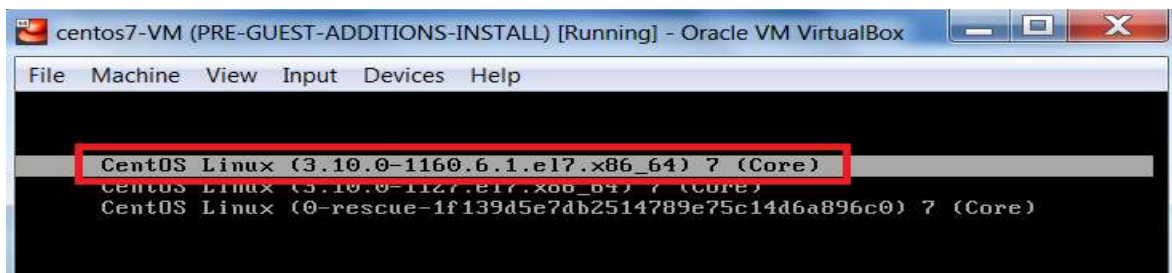

Remember to use your non-root user's password to acknowledge the following command:

```
$ sudo shutdown -r now // -r option used to reboot the system
```

A terminal window showing the output of system updates. The text includes package names like 'systemd-libs.x86_64', 'systemd-sysv.x86_64', 'tzdata.noarch', and 'yum-plugin-fastestmirror.noarch' along with their versions and architectures. Below this, it says 'Complete!'. The prompt is '[liam@centos7-vm ~]\$', and the command 'sudo shutdown -r now' is entered and highlighted with a red box.

You should notice that the newly installed kernel is now being used.

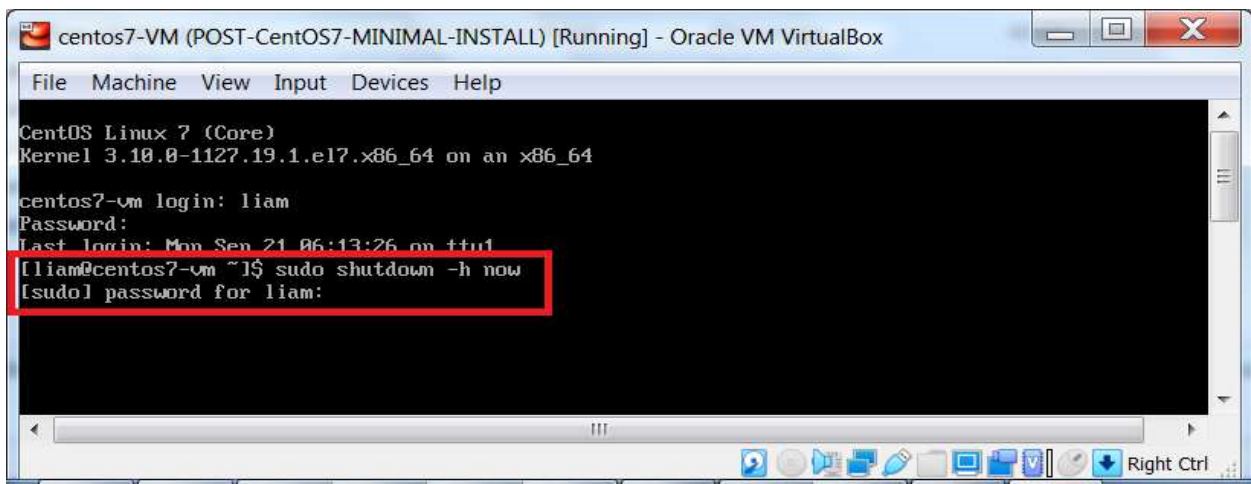

A screenshot of the Oracle VM VirtualBox window titled 'centos7-VM (PRE-GUEST-ADDITIONS-INSTALL) [Running]'. The main display area shows the boot output of the VM. The text 'CentOS Linux (3.10.0-1160.6.1.el7.x86_64) 7 (Core)' is highlighted with a red box, indicating the newly installed kernel.

Now that our CentOS 7 install is up-to-date, let's shutdown the VM and create another snapshot before installing VirtualBox's **Guest Additions**.

Remember to use your non-root user's password to acknowledge the following command:

```
$ sudo shutdown -h now // -h option used to halt the system
```

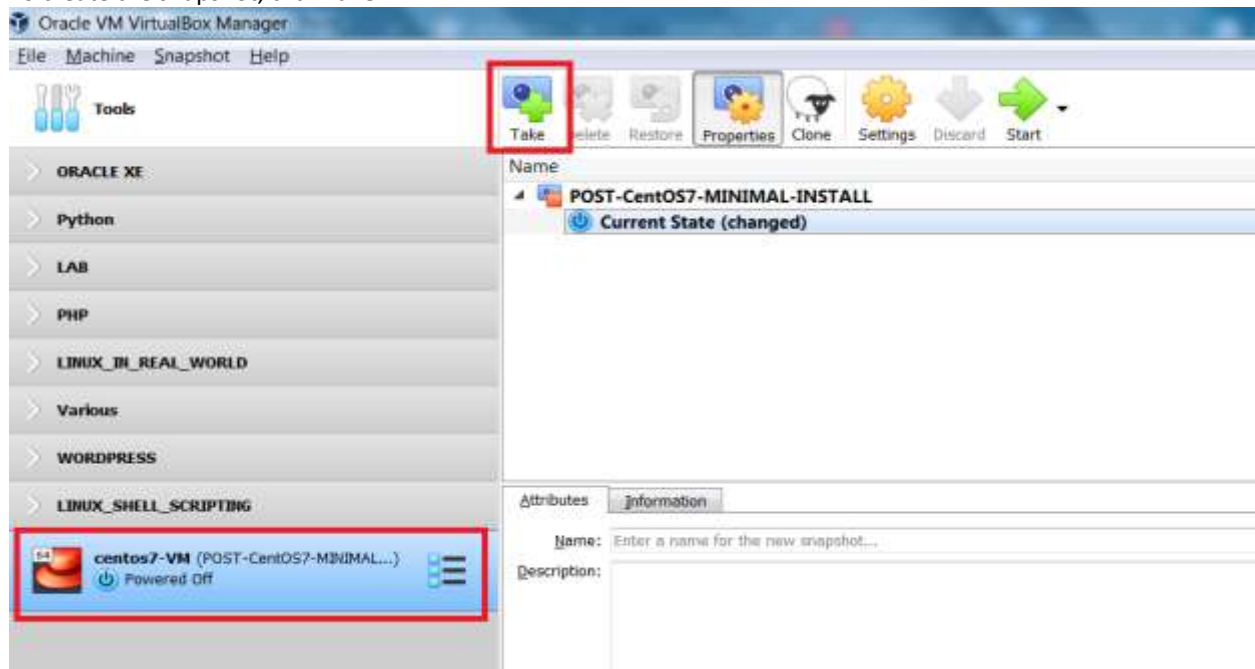

A screenshot of the Oracle VM VirtualBox window titled 'centos7-VM (POST-CentOS7-MINIMAL-INSTALL) [Running]'. The main display area shows the boot output of the VM. The text 'CentOS Linux 7 (Core)' and 'Kernel 3.10.0-1127.19.1.el7.x86_64 on an x86_64' are visible. Below this, the login prompt 'centos7-vm login: liam' is shown, followed by 'Password:'. The last login information is 'Last login: Mon Sep 21 06:13:26 on ttu1'. The command '[liam@centos7-vm ~]\$ sudo shutdown -h now' is entered and highlighted with a red box, followed by the prompt '[sudo] password for liam:'.

Take Pre Guest Additions Install Snapshot

From the VirtualBox Manager interface, ensure your VM is selected and you are in “**Snapshots**” view.

To create the snapshot, click **Take**

Enter a name for the snapshot, as well as, a short description, then, click **OK**

I've taken a snapshot "**PRE-GUEST-ADDITIONS-INSTALL**" to ensure that we have an updated CentOS 7 minimal install we can revert back to.

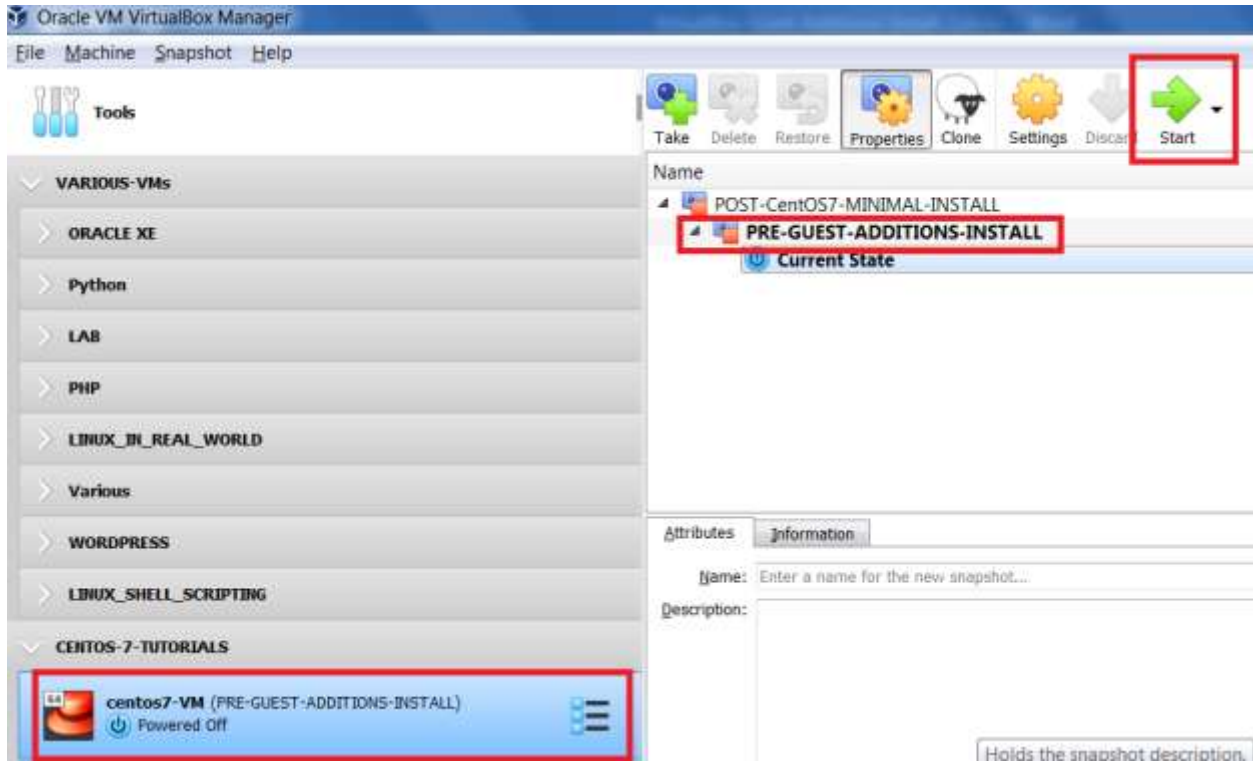

Now that we have our snapshot in place, we are ready to install the **Guest Additions**.

VirtualBox Guest Additions

In the VirtualBox Manager interface, you should now see your newly created snapshot.

Ensure your VM is selected and click **Start**

Prerequisite Packages Install

Before we can install VirtualBox's **Guest Additions**, we will need to ensure our current kernel has the corresponding **kernel-headers**. The kernel headers are used when you want to compile a new kernel module that interfaces directly with the kernel (in this case, the **Guest Additions**).

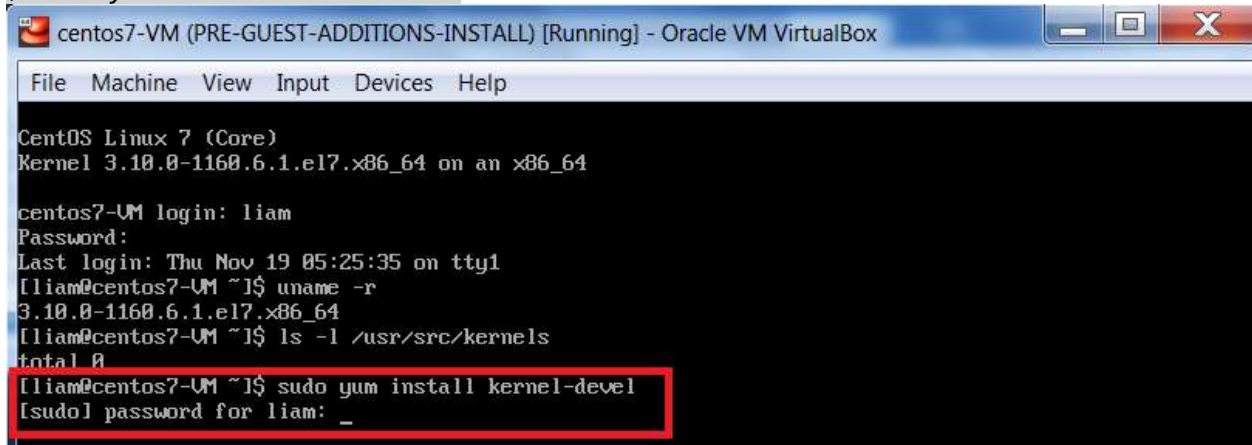

First, we will verify whether, or not, the kernel-headers exist. From the command line, execute the following:

```
$ uname -r // display active kernel release information
$ ls -l /etc/src/kernels // location of kernel-header files
```

We see that no matching kernel-headers exist so we will need to install the **kernel-devel** package which provides **kernel-headers**. To do this, execute the following:

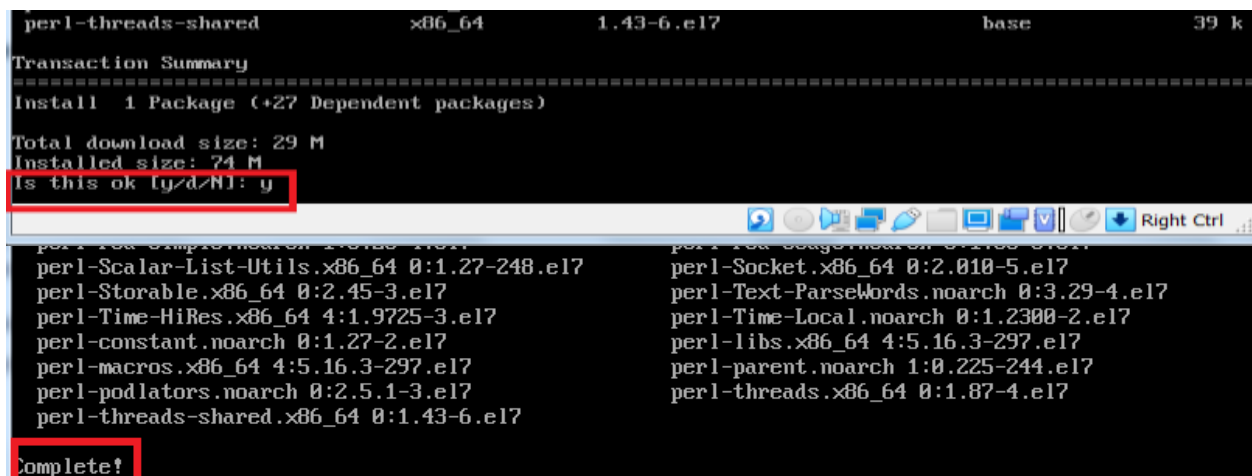

```
$ sudo yum install kernel-devel
```

The screenshot shows a terminal window titled "centos7-VM (PRE-GUEST-ADDITIONS-INSTALL) [Running] - Oracle VM VirtualBox". The terminal output shows the user "liam" logging in and running the command "sudo yum install kernel-devel". The command is highlighted with a red box. The prompt "password for liam:" is visible, but the password is not shown.

If prompted, enter your non-root user's password to confirm command execution.

When prompted to download, and install, the package, and its dependencies, enter **y** (yes)

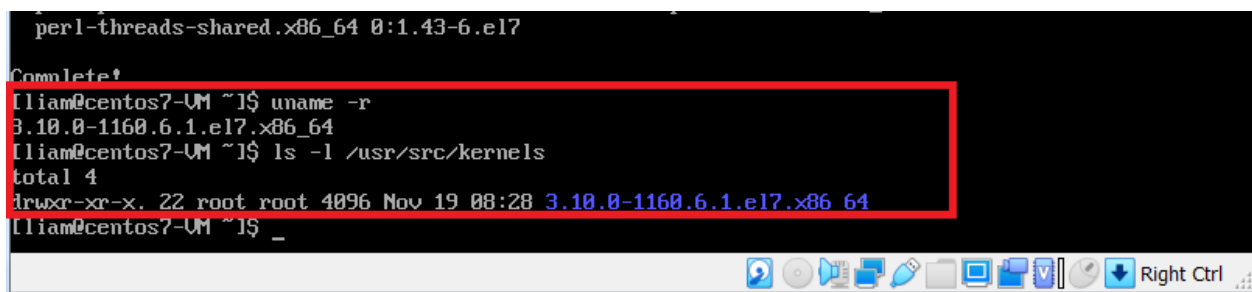

The screenshot shows the output of the yum command, displaying a transaction summary. The summary indicates that 1 package (+27 dependent packages) will be installed, with a total download size of 29 M and an installed size of 74 M. The prompt "Is this ok [y/d/N]:" is highlighted with a red box, and the user has entered "y". Below the summary, a list of packages to be installed is shown, including perl-threads-shared, perl-Scalar-List-Utils, perl-Storable, perl-Time-HiRes, perl-constant, perl-macros, perl-podlators, and perl-threads. The word "Complete!" is also visible at the bottom of the list.

The kernel-devel package was successfully installed.

Now, we will verify that our matching kernel-headers exist by executing the following:

```
$ uname -r // display active kernel release information
$ ls -l /etc/src/kernels // location of kernel-header files
```

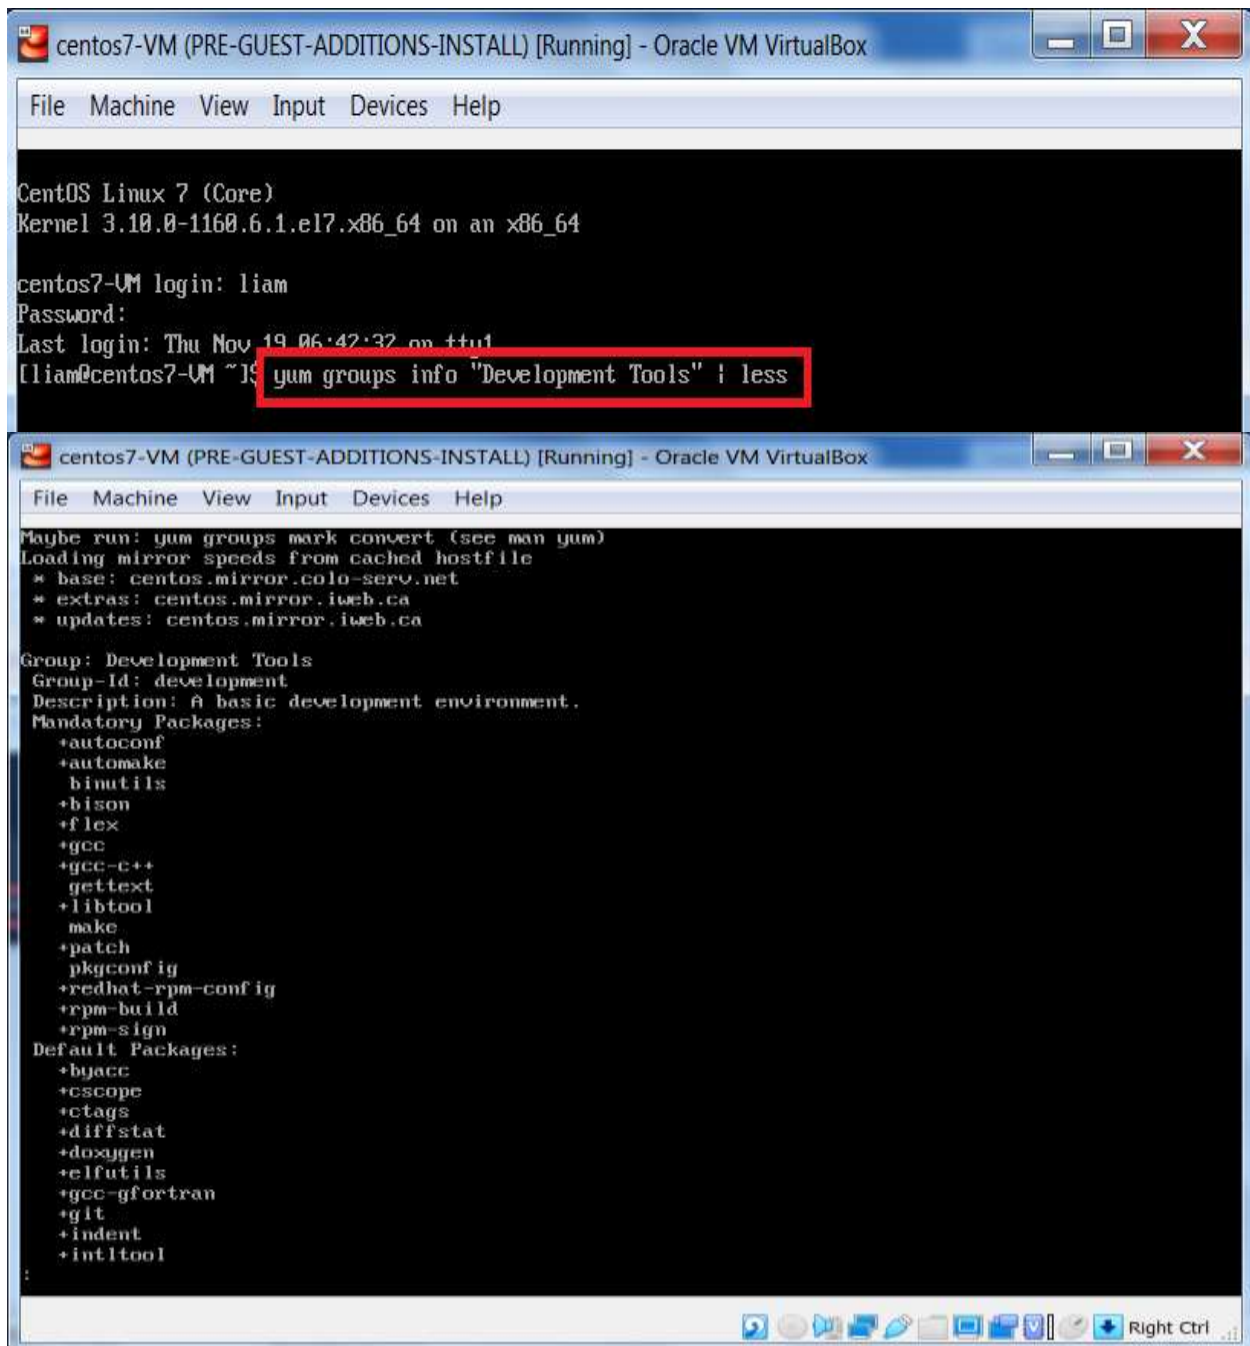

The screenshot shows the terminal window after the installation of kernel-devel. The user "liam" runs the command "uname -r", which outputs "3.10.0-1160.6.1.el7.x86_64". The user then runs the command "ls -l /usr/src/kernels", which outputs "total 4" and "drwxr-xr-x. 22 root root 4096 Nov 19 08:28 3.10.0-1160.6.1.el7.x86_64". The output of the "ls" command is highlighted with a red box.

We now see the matching kernel-headers. But, before we can install VirtualBox's **Guest Additions**, we also need to install a few required packages that are used during the installation of the guest additions. These packages are nicely grouped in "**Development Tools**" which provides a basic development environment that will allow you to do many things on the system, including build kernel modules, which is required for a successful installation of VirtualBox's Guest Additions.

First to get an idea which packages are included in "**Development Tools**", execute the following:

(Note that the '**less**' command allows for page navigation using your keyboard's up/down, and spacebar, keys.)

```
$ yum groups info "Development Tools" | less
```

The image shows two screenshots of a CentOS 7 VM terminal window. The first screenshot shows the command `yum groups info "Development Tools" | less` being executed. The second screenshot shows the output of the command, which lists the packages included in the "Development Tools" group.

```
centos7-VM (PRE-GUEST-ADDITIONS-INSTALL) [Running] - Oracle VM VirtualBox
File Machine View Input Devices Help

CentOS Linux 7 (Core)
Kernel 3.10.0-1160.6.1.el7.x86_64 on an x86_64

centos7-VM login: liam
Password:
Last login: Thu Nov 19 06:42:32 on ttu1
[liam@centos7-VM ~]$ yum groups info "Development Tools" | less

Maybe run: yum groups mark convert (see man yum)
Loading mirror speeds from cached hostfile
 * base: centos.mirror.colo-serv.net
 * extras: centos.mirror.iweb.ca
 * updates: centos.mirror.iweb.ca

Group: Development Tools
Group-Id: development
Description: A basic development environment.
Mandatory Packages:
+autoconf
+automake
+binutils
+bison
+flex
+gcc
+gcc-c++
+gettext
+libtool
+make
+patch
+pkgconfig
+redhat-rpm-config
+rpm-build
+rpm-sign
Default Packages:
+byacc
+cscope
+ctags
+diffstat
+doxygen
+elfutils
+gcc-gfortran
+git
+indent
+intltool
```

You will notice that many packages are included. Enter 'q' to quit and return to the command line.

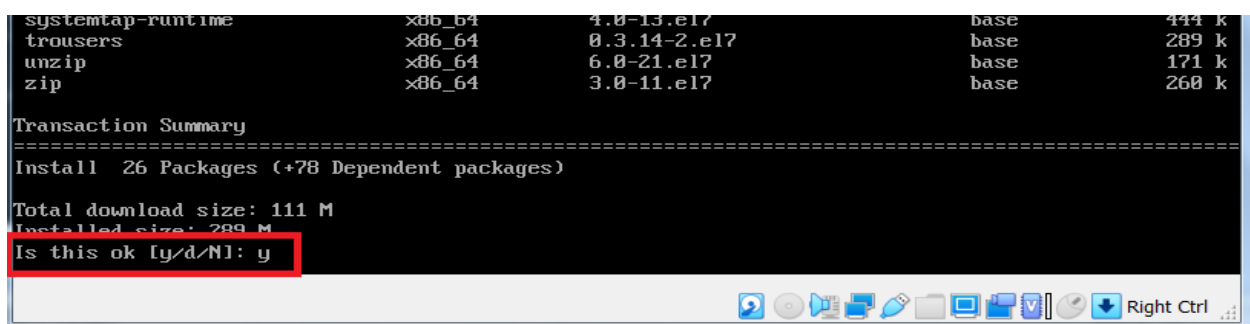

Now, we will install the grouped packages by executing:

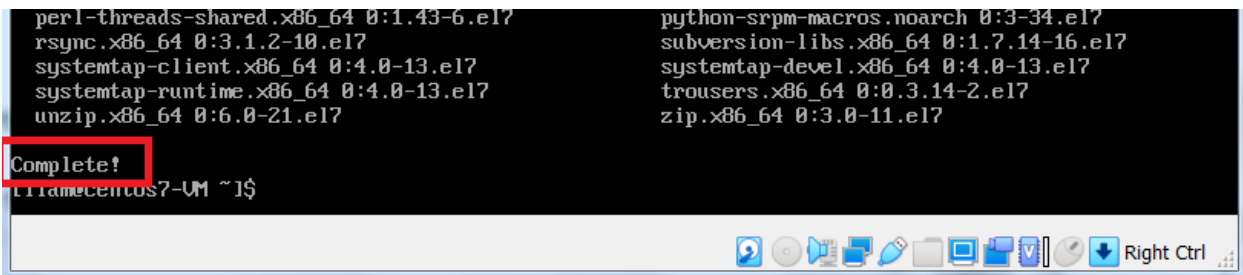

```
$ sudo yum groups install "Development Tools"
```

If prompted, enter your non-root user's (in my case, **liam**) password to confirm command execution.

Then, when prompted to download, and install, the packages, enter **y** (yes).

Guest Additions Install

Now that our basic development environment is in place, we can begin the **Guest Additions** installation. First, we need access to the guest VM's **main menu**.

In order to access the virtual machine's **main menu**, you will need to exit the **guest** (virtual machine) interface by hitting your **Host key**. Check the bottom right-hand corner of the virtual machine's interface to determine what your **Host key** is. For my Windows 7 host machine, my **Host key** is the **right Ctrl key** (see image below).

Now you know how to exit the guest interface to access your virtual machine's main menu.

From the virtual machine's main menu, select **Devices**, then click **Insert Guest Additions CD image**

Now that we've inserted the **Guest Additions CD image**, we will have to mount the CD image so that we can access its contents to perform the installation. To do this, execute the following commands (one after the other):

```
$ sudo mount /dev/cdrom /media // mount CD image to an existing directory
$ cd /media // change to that directory
$ ls -l // view the contents of the mounted CD image
```

```
Complete!
[liam@centos7-UM ~]$ sudo mount /dev/cdrom /media
[sudo] password for liam:
mount: /dev/sr0 is write-protected, mounting read-only
[liam@centos7-UM ~]$ cd /media
[liam@centos7-UM media]$ ls -l
total 45524
-r--r--r--. 1 root root    763 Mar 13  2019 AUTORUN.INF
-r-xr-xr-x. 1 root root   6384 Mar 13  2019 autorun.sh
dr-xr-xr-x. 2 root root    792 Jan 13  2020 cert
dr-xr-xr-x. 2 root root   1824 Jan 13  2020 NT3x
dr-xr-xr-x. 2 root root   2652 Jan 13  2020 OS2
-r-xr-xr-x. 1 root root   4821 Mar 13  2019 runasroot.sh
-r--r--r--. 1 root root    547 Jan 13  2020 TRANS.TBL
-r--r--r--. 1 root root 3744169 Jan 13  2020 VBoxDarwinAdditions.pkg
-r-xr-xr-x. 1 root root    3949 Jan 13  2020 VBoxDarwinAdditionsUninstall.tool
-r-xr-xr-x. 1 root root 6716837 Jan 13  2020 VBoxLinuxAdditions.run
-r-xr-xr-x. 1 root root 3287888 Jan 13  2020 VBoxSolarisAdditions.pkg
-r-xr-xr-x. 1 root root 16776232 Jan 13  2020 VBoxWindowsAdditions-amd64.exe
-r-xr-xr-x. 1 root root  270616 Jan 13  2020 VBoxWindowsAdditions.exe
```

Finally, execute the following:

```
$ sudo ./VBoxLinuxAdditions.run // install Guest Additions, for a Linux guest, by
                                // executing the script
```

```
[liam@centos7-UM media]$ sudo ./VBoxLinuxAdditions.run
Verifying archive integrity... All good.
Uncompressing VirtualBox 6.1.2 Guest Additions for Linux.....
VirtualBox Guest Additions installer
Copying additional installer modules ...
Installing additional modules ...
VirtualBox Guest Additions: Starting.
VirtualBox Guest Additions: Building the VirtualBox Guest Additions kernel
modules. This may take a while.
VirtualBox Guest Additions: To build modules for other installed kernels, run
VirtualBox Guest Additions: /sbin/rcvboxadd quicksetup <version>
VirtualBox Guest Additions: or
VirtualBox Guest Additions: /sbin/rcvboxadd quicksetup all
VirtualBox Guest Additions: Building the modules for kernel
3.10.0-1160.6.1.el7.x86_64.
```

The **Guest Additions** were successfully installed. We can verify that the kernel modules needed by the **Guest Additions** have been successfully built by executing the following command:

```
$ lsmod | grep -i vbox // 'lsmod' shows the status of modules in the Linux kernel.
```

```
[liam@centos7-UM media]$ lsmod | grep -i vbox
vboxsf      81052  0
vboxguest   348326  2 vboxsf
vboxvideo   35867  0
drm_kms_helper 186531  2 vmwgfx,vboxvideo
ttm         96673  2 vmwgfx,vboxvideo
drm         456166  5 ttm,drm_kms_helper,vmwgfx,vboxvideo
[liam@centos7-UM media]$
```

After installing VirtualBox's Guest Additions, it's a good idea to reboot the system to ensure all necessary system changes take effect.

From the command line, execute the following:

```
$ sudo shutdown -r now
```

Test Guest Additions Features

Since we are in a minimal server environment, it is difficult to test out added Guest Addition features such as the “**Shared Clipboard**” or “**Drag ‘n Drop**”. But we can test access to shared folders, which provide access to host machine resources and can be very handy. Furthermore, we can test our ability to control the VM from our host machine. This can be accomplished using the [VBoxManage guestcontrol](#) command.

Shared Folders

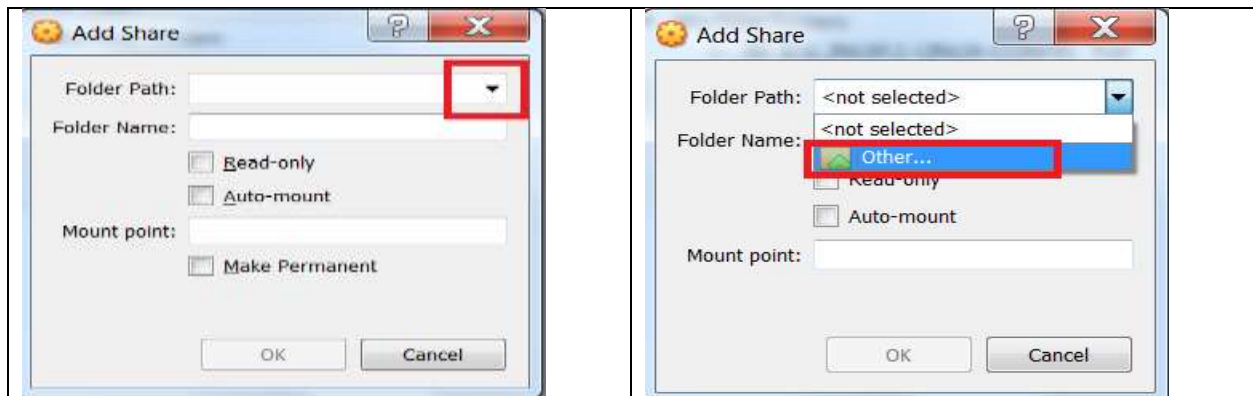

Our first test will be to create a shared folder using the VM's settings dialog box. Since your VM is currently running, switch back to the VirtualBox Management interface, ensure your running VM is selected and click the **Settings** button, as indicated below.

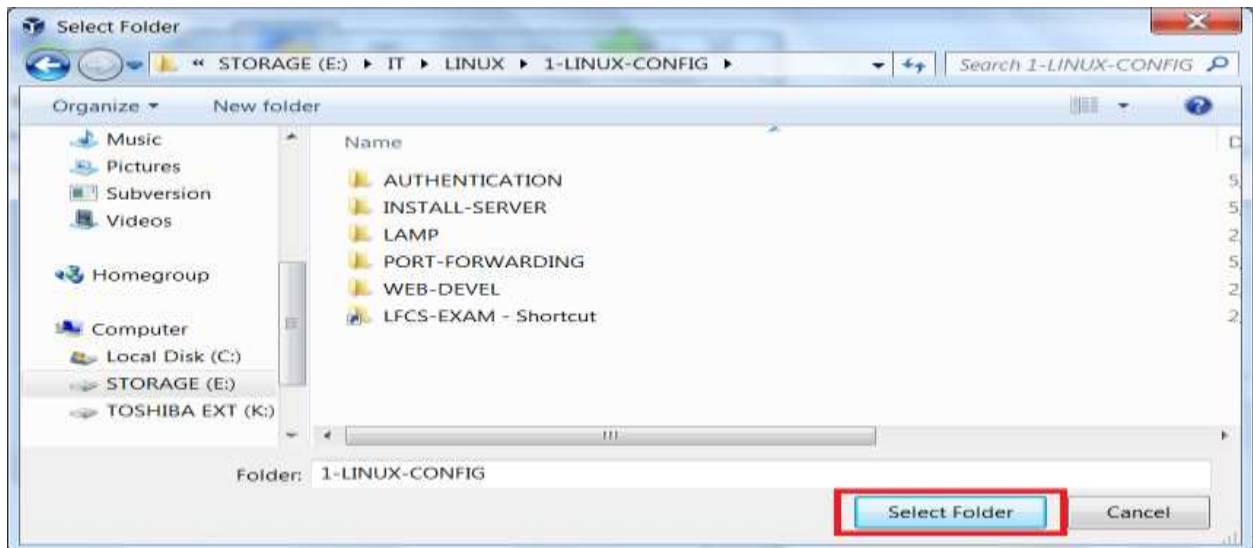

In the VM Settings dialog box, on the left, select **Shared Folders**. You'll notice, on the right, that there are no shared folders. To create a shared folder, click the icon that **Adds new shared folder**.

Once the **Add Share** dialog box opens, click the drop-down next to “**Folder Path:**” and click **Other**.

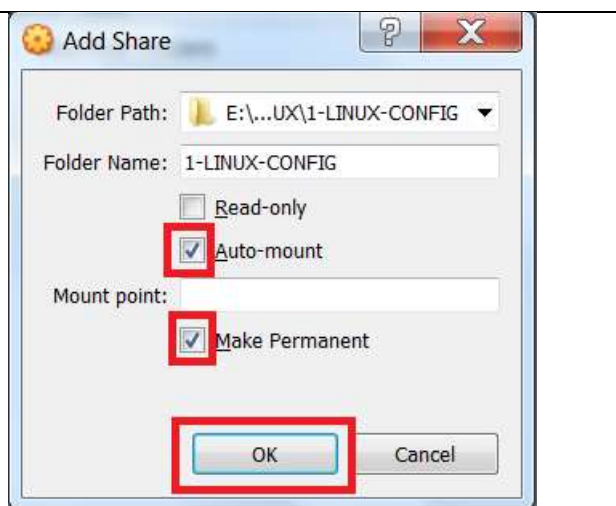

You will now select which folder on your host machine that you would like to share with your guest VM. Select your folder (will be different than mine) and click **Select Folder**.

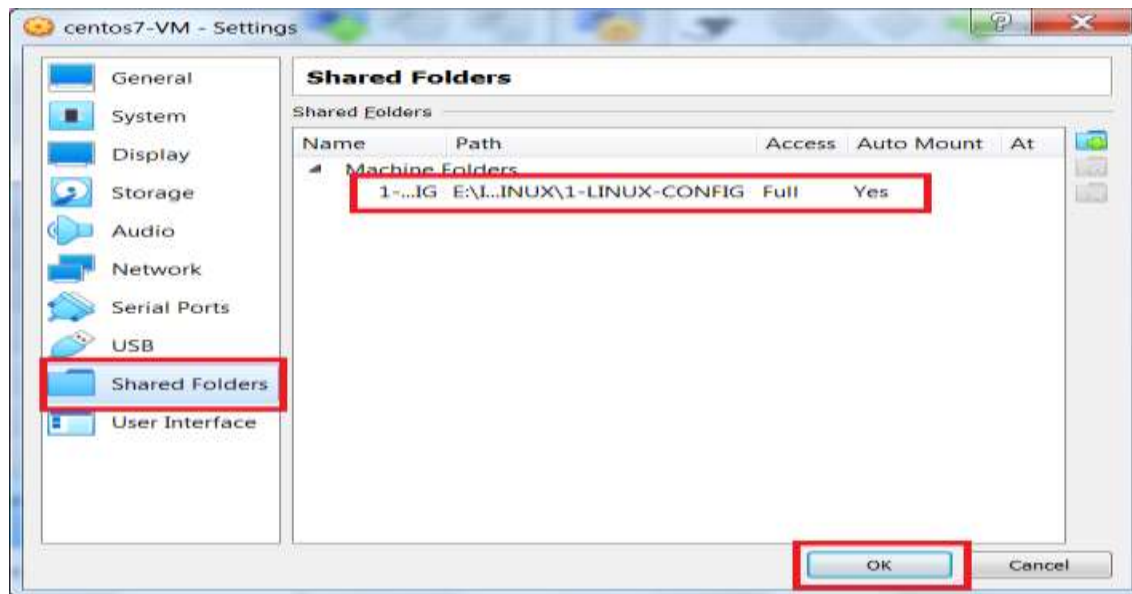

Once you’ve selected your shared folder, the **Add Share** dialog box reappears.

Check both the ‘**Auto-mount**’ and ‘**Make Permanent**’ checkboxes. This will ensure that the shared folder will be available to the guest VM whenever the virtual machine is running.

Finally, to create the shared folder, click **OK**

From the guest VM's settings dialog box we can see our newly created shared folder. To continue, click **OK**

Now that we have created a shared folder, let's confirm that it is available to the guest VM. Return to the guest VM's interface and execute the following commands:

```
$ ls -l /media // storage location for shared folders
$ mount | grep "sf_1-LINUX*" // verify that shared folder is now mounted to guest VM
// note, 'sf_' prepended to the shared folder name
```

Please note in the image above that the **'root'** user is the owner of the shared folder, while membership in the **'vboxsf'** group is required to access the shared folder. We will prove that by attempting to change directories to the shared folder as a non-root user (in my case **liam**) that is not a member of the **'vboxsf'** group.

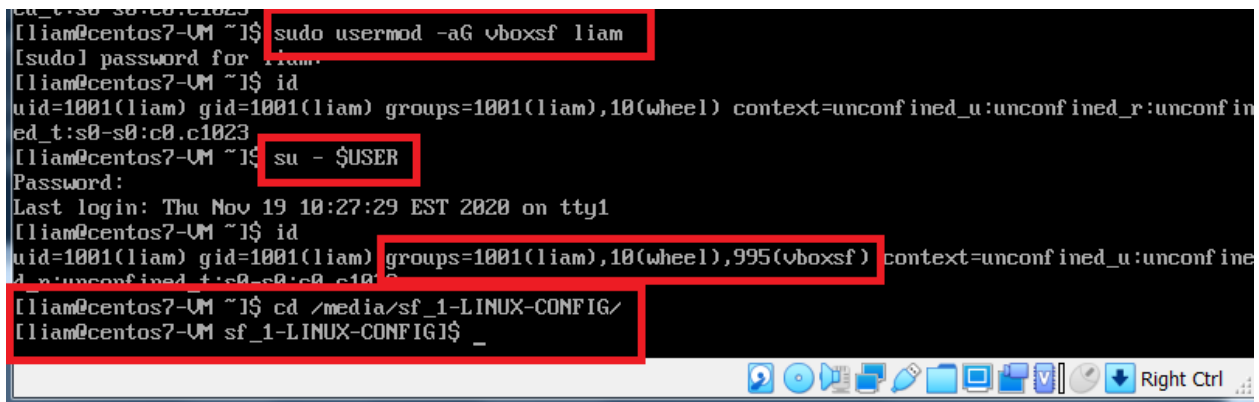

As your non-root user, execute:

```
$ id // display user account information, including group membership
$ cd /media/sf_1-LINUX-CONFIG // 'vboxsf' group membership required to access shared folder
// (Please note that your shared folder name will be
// different than mine)
```

We will change our non-root user's group membership. Then, instead of having to logout to force the update of the non-root user's group membership, we will use the 'su' (switch user) command with the environment variable \$USER (refers to current active user) to switch to the SAME user (again, in my case, liam), by executing the following:

```
$ sudo usermod -aG vboxsf liam // add non-root user to 'vboxsf' group
$ su - $USER // switch user to SAME active user
// to update group membership
$ id // display account info, including group membership
$ cd /media/sf_1-LINUX-CONFIG // confirm that access has been granted
```

A terminal window screenshot from a CentOS 7 VM. The user 'liam' is at the prompt. They run 'sudo usermod -aG vboxsf liam', which prompts for a password. Then they run 'id', showing they are in the 'wheel' group. Next, they run 'su - \$USER', which prompts for a password. After running 'id' again, they see they are now in the 'vboxsf' group. Finally, they run 'cd /media/sf_1-LINUX-CONFIG/' and the prompt changes to 'sf_1-LINUX-CONFIG\$'.

```
liam@centos7-VM ~]$ sudo usermod -aG vboxsf liam
[sudo] password for liam:
liam@centos7-VM ~]$ id
uid=1001(liam) gid=1001(liam) groups=1001(liam),10(wheel) context=unconfined_u:unconfined_r:unconfined_t:s0-s0:c0.c1023
liam@centos7-VM ~]$ su - $USER
Password:
Last login: Thu Nov 19 10:27:29 EST 2020 on tty1
liam@centos7-VM ~]$ id
uid=1001(liam) gid=1001(liam) groups=1001(liam),10(wheel),995(vboxsf) context=unconfined_u:unconfined_r:unconfined_t:s0-s0:c0.c1023
liam@centos7-VM ~]$ cd /media/sf_1-LINUX-CONFIG/
liam@centos7-VM sf_1-LINUX-CONFIG$ _
```

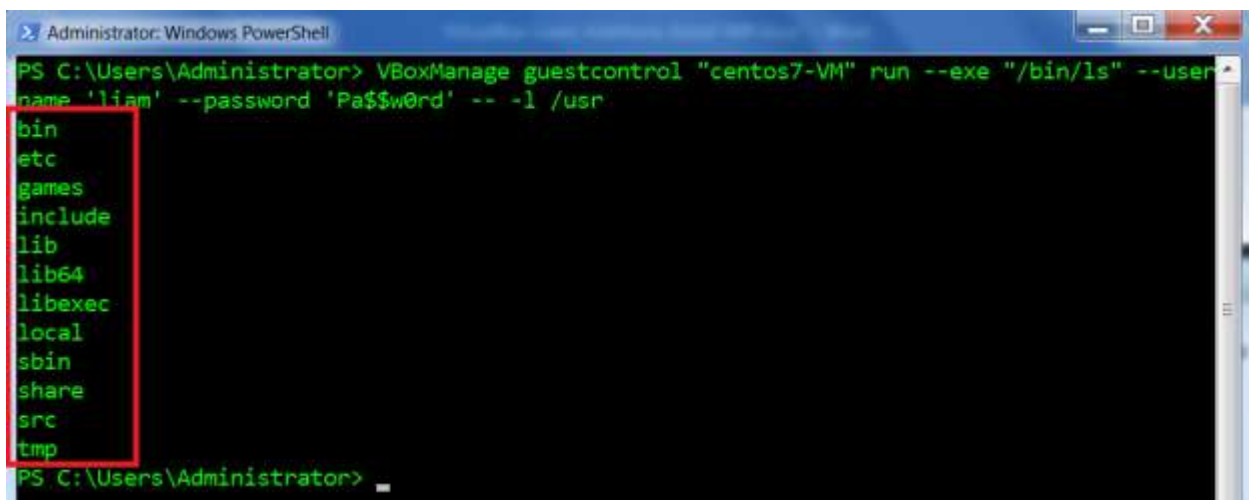

The non-root user was added to the 'vboxsf' group and is now able to access the shared folder. This non-root user will also be able to access any other shared folders that are created for this virtual machine.

Now, we will perform a simple test to ensure we can execute commands on the guest VM from the host machine.

Remote VM Management

To perform our test, open PowerShell and execute the entire command on a single line. The following command will list the contents of the '/usr' directory of our CentOS 7 VM. (use your non-root username & password)

```
VBoxManage guestcontrol "centos7-VM" run --exe "/bin/ls" --username '<username>' --password '<password>' -- -l /usr
```

A Windows PowerShell window screenshot. The user runs the command 'VBoxManage guestcontrol "centos7-VM" run --exe "/bin/ls" --username "liam" --password "Pa\$\$w0rd" -- -l /usr'. The output shows a list of directories in the /usr folder: bin, etc, games, include, lib, lib64, libexec, local, sbin, share, src, tmp.

```
PS C:\Users\Administrator> VBoxManage guestcontrol "centos7-VM" run --exe "/bin/ls" --username "liam" --password "Pa$$w0rd" -- -l /usr
bin
etc
games
include
lib
lib64
libexec
local
sbin
share
src
tmp
PS C:\Users\Administrator> _
```

We have successfully installed the VirtualBox Guest Additions for a CentOS 7 minimal install and confirmed that we can create, and access, shared folders, as well as, execute commands on the guest VM from the host machine.

Now would be a good time to take a snapshot. That way, if we ever need a CentOS 7 server virtual machine that already has VirtualBox's Guest Additions installed, we can clone this snapshot in seconds.

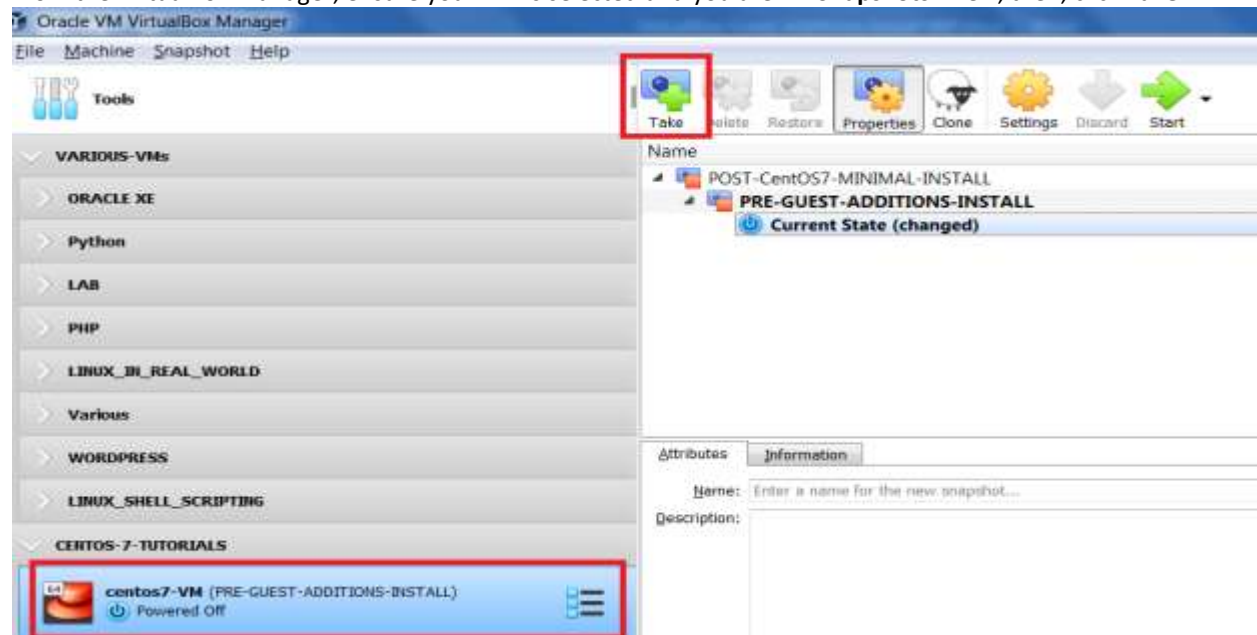

From the command line, execute the following:

```
$ sudo shutdown -h now
```

```
l1am@centos7-UM media1$ lsmod | grep -i vbox
vboxsf            81852  0
vboxguest         348326  2 vboxsf
vboxvideo         35867  0
drm_kms_helper    186531  2 vmwgfx,vboxvideo
ttm               96673  2 vmwgfx,vboxvideo
drm              456166  5 ttm,drm_kms_helper,vmwgfx,vboxvideo
l1am@centos7-UM media1$ sudo shutdown -h now
lsudol password for l1am:
```

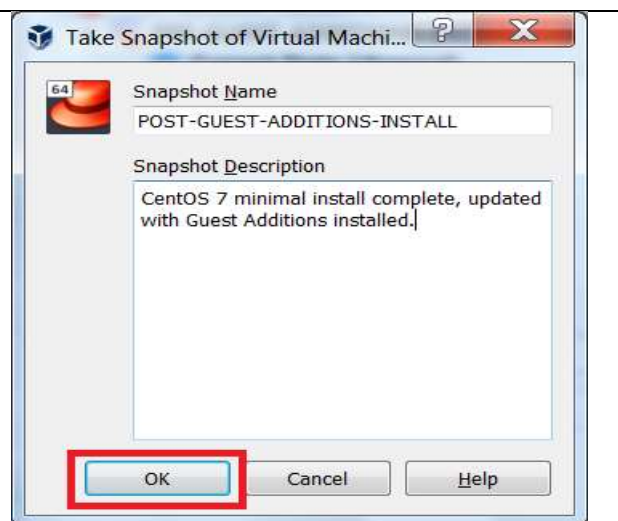

Take Post Guest Additions Snapshot

From the VirtualBox Manager, ensure your VM is selected and you are in “Snapshots” view, then, click **Take**

Enter a name for the snapshot, as well as, a short description, then, click **OK**

I've taken a snapshot "**POST-GUEST-ADDITIONS-INSTALL**" to ensure that we have a CentOS 7 server VM that has VirtualBox's Guest Additions installed, which can be cloned for future use.

We have successfully installed VirtualBox's **Guest Additions** on a **CentOS 7 minimal install VM**.

Along the way we created a couple of snapshots to act as fallback mechanisms. At any time, if a virtual machine becomes unresponsive, we can always revert back to a working snapshot. We can also clone a snapshot, as long as, the snapshot was taken when the virtual machine was powered off.

Hopefully, you've enjoyed completing this tutorial and found it helpful.

If you would like to see my other tutorials, they can be accessed [here](#).

[Back to top](#)
